

DungeonBases Building Guide

The dungeon consists of two buildings: the entrance to the dungeon and the dungeon itself.

Basic instructions for building a dungeon entrance

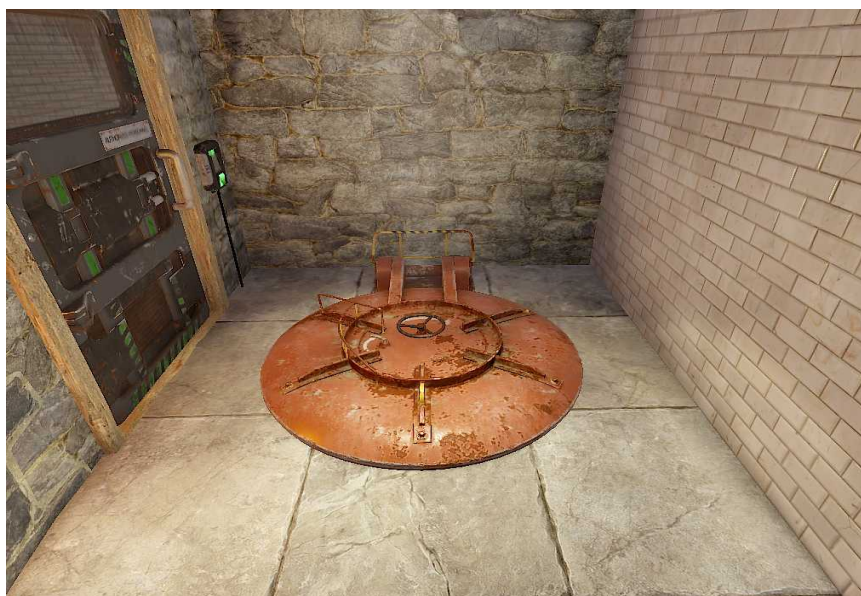

1. The size of the building should be no more than 4 by 4 foundations (2 by 2 is recommended), the height of the building does not matter
2. The entrance building must have an entrance hatch (only one!) - the entrance to the dungeon
3. To create a hatch on the foundation, deploy a Large Planter Box on the foundation as follows

Place 1 fertilizer in the first slot of the Planter Box and 999 in the last one

If you did everything correctly, after the event is launched, a hatch will be deployed on the foundation

4. To copy a building, you need to stand on the foundation of the building as close to the center of the foundations as possible

It is necessary to look at the center of the foundations or as close to it as possible

After that, copy the building using the /copy command

5. The file name should contain #dung#

If you use elevators in the building, then when copying the building, the elevator must be in the upper position.

Basic instructions for building a dungeon

As a rule, the size of the dungeon can be much larger than the entrance building. You can build as many large buildings as you want, within reasonable limits. Copy the building, standing on the foundation, preferably located closer to the middle of the foundations. If you have difficulties with copying large buildings, perhaps the building will not be copied completely, but only partially, then use the instructions for the CopyPaste plugin.

If you use elevators in the building, then when copying the building, the elevator must be in the upper position.

1. The dungeon must have an entrance hatch (only one!)
2. To create a hatch in the ceiling, install a ladder hatch in the required place, open it. Install a combination lock on the hatch and lock the lock by setting the code 0707

3. If you did everything correctly, after the event starts, a hatch will spawn in the building

4. After that, copy the build using the /copy command. The file name should contain #dung#

Important: By default, all dungeon buildings will be indestructible

How to create green, blue, red security doors

1. Install a wooden, metal or armored door
2. Install the combination lock and lock it using the code 0707

If everything is correct, then when the event is loaded, green, blue and red security doors will spawn respectively

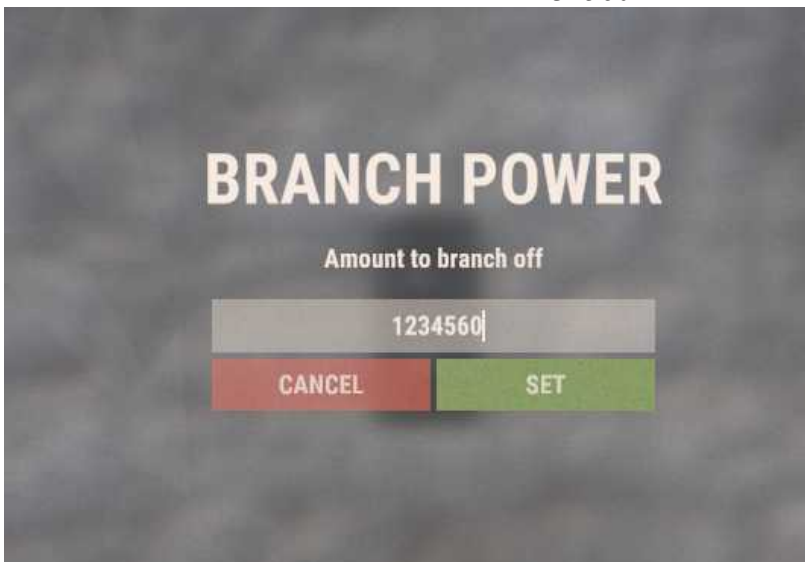

How to make a Door Card Reader

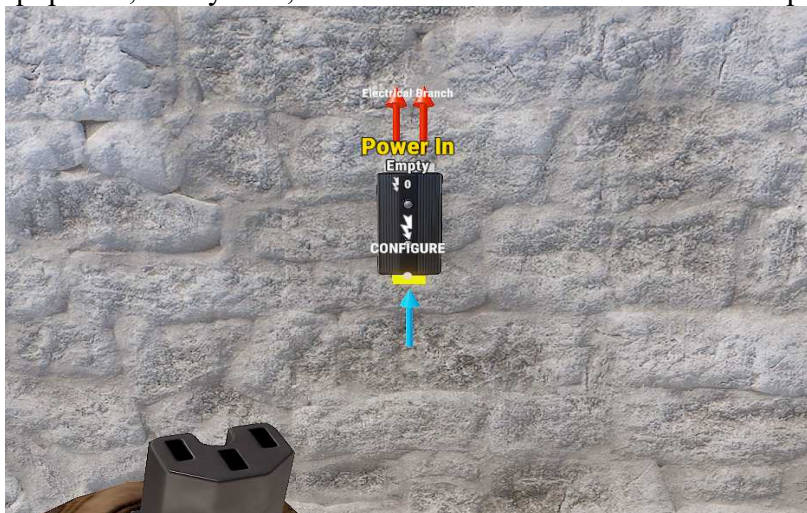

1. Install an electrical branch near the door

2. Set the value “Amount to branch off” to 1234560

3. Connect the power supply to the lower input (possibly through a switch or other switching equipment, in any case, the card reader will not work without power supply)

4. Do not use other splitters to power it, or do it through a power combiner. The figure shows the schematic diagram:

5. Try not to place such doors too close to each other, otherwise the card reader may not connect correctly to one or another door

If everything is done correctly, then when loading the event, the card reader will connect to the nearest door

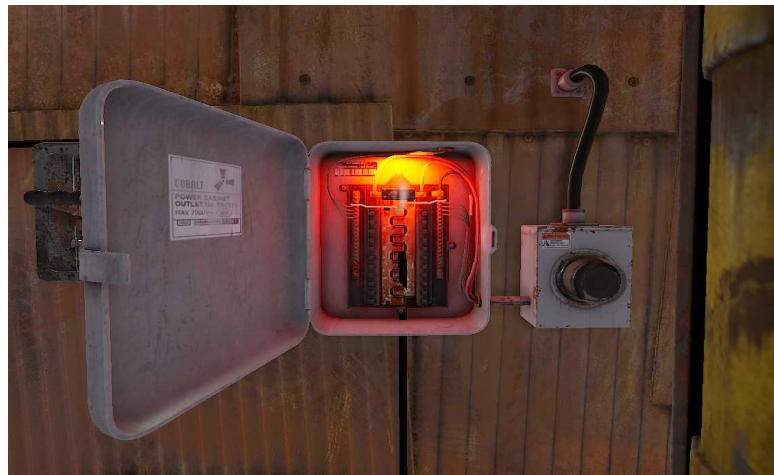

How to create a fuse box

The fuse box is created in the same way as a card reader

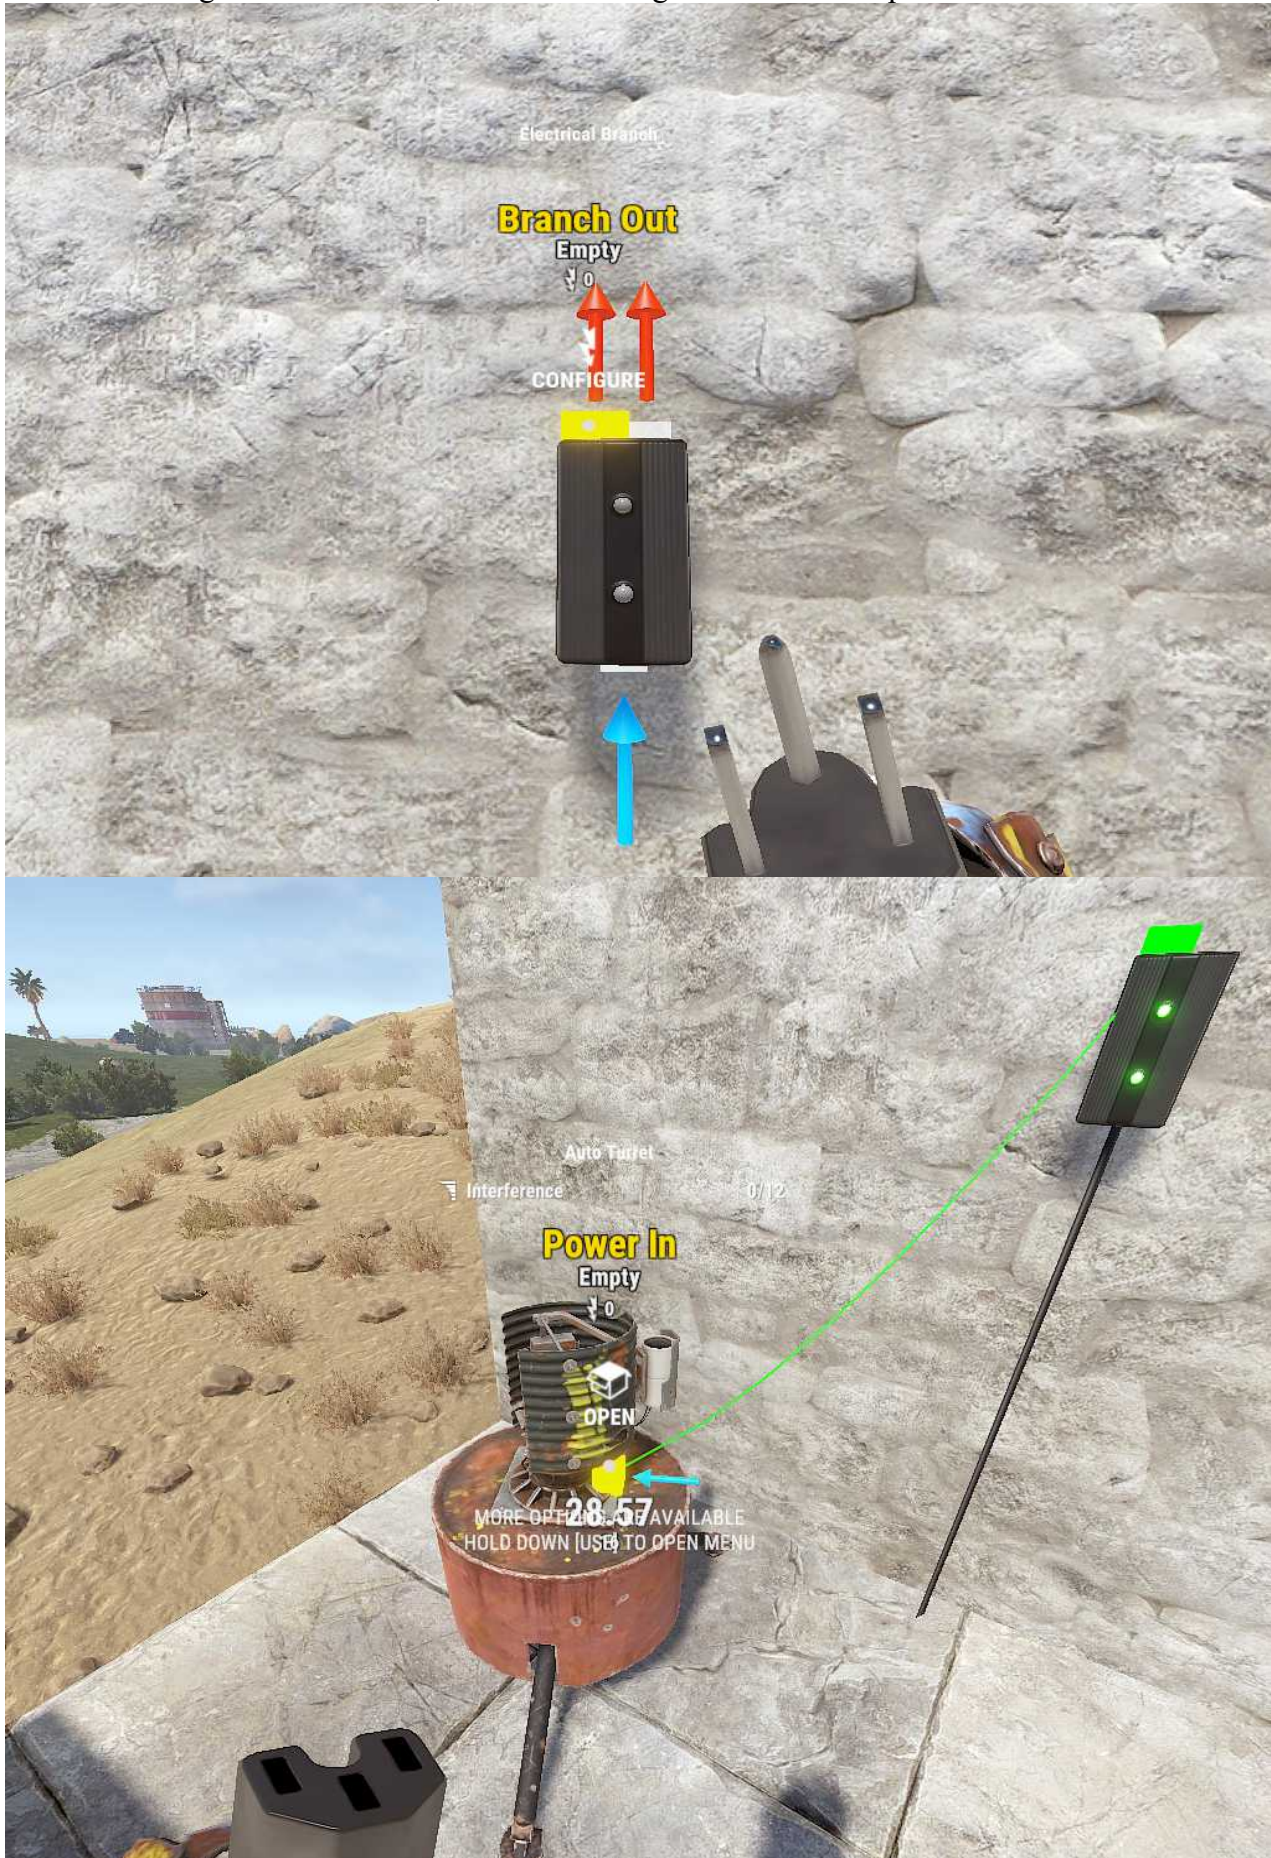

1. Install an electrical branch
2. Set the value “Amount to branch off” to 1234561
3. Do not use other splitters to power it, or do it through a power combiner.

If everything is correct, then after the event is launched, instead of the electrical branch, a fuse box will spawn

Setting up an autoturret

To configure the autoturret, connect it through the Branch Output of the Electrical Branch

Next, configure the electrical branch as follows:

The first 2 digits must be 99, otherwise the configuration will be ignored:

The next number determines whether the autoturret will be indestructible. 1 - cannot be destroyed, 0 - can be destroyed:

The next number determines whether the autoturret will automatically refill its ammo. 1 - auto-refill, 0 - not refill:

The next number determines whether weapon and ammo will drop after a turret is destroyed. 1 - weapon will not drop, 0 - will drop as usual:

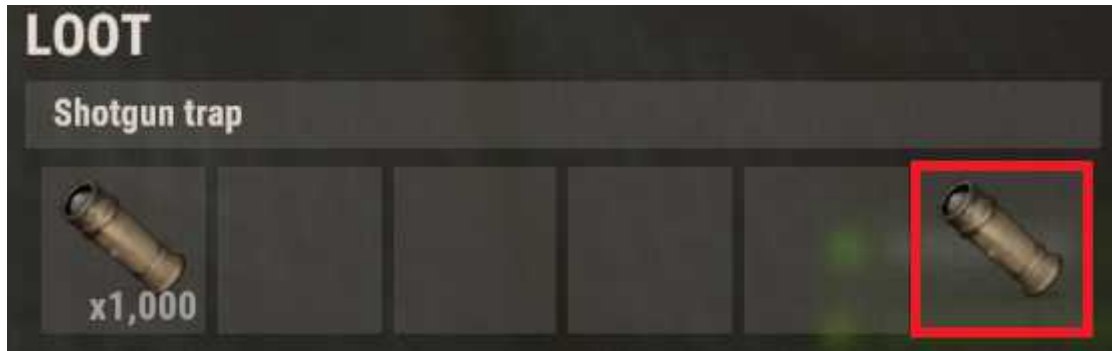

For example, if you want an autoturret that can be destroyed, will not drop weapons when destroyed, but will automatically refill its ammo, then configure the electrical branch as follows: **99011**

Setting up the Shotgun Trap

The guntrap has one setting. By default, the guntrap can be destroyed.

To make the shotgun trap invulnerable, you need to place 1 handmade shell in the last slot

How to make the code lock on the door impossible to open

Sometimes there is a need to install doors that players cannot open. This is necessary for decoration. If you install a simple keylock on a door and close it, then when you deploy the structure using the CopyPaste plugin, the lock may be open. To ensure that the door is always locked, install a codelock with the code 1818 on it.

How to install event end time counter

1. Place the counter on the wall

2. Set “Target value for power to pass through” 707

If everything is correct, then after the event is launched, the counter will show the time until the end of the event in seconds. The counter does not need to be connected to power.

How to create an NPC or other prefab

1. Place a wooden box

2. Place the note in the first slot of the box and specify the necessary parameters in it as in the picture. It is not necessary to specify all the parameters, it is enough to specify only the name of the prefab

Parameters:

prefab – prefab name

height – height offset

right – right offset

forward – forward offset

tableName - loot table name for SimpleLootTable(case sensitive)

tableMinItems - minimum number of items for SimpleLootTable
 tableMaxItems - maximum number of items for SimpleLootTable
 health – health (only for scientist prefabs)
 displayname – changes the display name of the npc (only for scientist prefabs)
 static – if true, then the NPC will be stationary (only for scientist prefabs)
 weapon - shortname of weapons for NPCs (only for NPCs, use the usual weapons for NPCs, otherwise with some types of weapons NPCs will work incorrectly)
 kit – name of the kit for NPC(the weapon must be in the first slot of the belt container. Plugin Kits is required)
 dmgscale - NPC damage scale

You can use custom loot tables for both crates and NPCs.

If everything is correct, then after the event is launched, instead of the box, the object whose prefab name you specified in the note will spawn

Another example:

Do not create scientists in the dungeon entrance building on those floors where there is an exit to the outside. Or you can create them, but make them static. Otherwise, scientists can pursue the player outside the building, this is fraught with the fact that scientists will be in the air.

How to create a note with a door code

1. Install the door with a code lock and lock the lock, the code can be any
2. Install the Door Controller on the door

3. Install RF Broadcaster on the box you want to connect the door to and connect it to the Door Controller

If this box is used to spawn an NPC, then after the player kills the NPC, he will be able to find a note with the code for this door inside the NPC's corpse.

Do not use prefabs to create code notes, except for NPC prefabs

If you just want to get the note with the code inside the box, do the same with any box, just leave at least one slot free
